

Debriefing Assignment 2: Mini Games

Wenzuo Xia

In this project, I tried to build a humorous and consistent game where the player controls a drunk man who must manage his body behaviors in unusual and comedic scenarios. The core idea I liked most was combining very ordinary actions such as peeing or pooping, like balancing side-to-side movement or being monitored by characters inside the environment. This mix of daily actions and playful mechanics created tension that was both funny and engaging. What I particularly enjoyed was how the project pushed me to think creatively about how to represent gross actions through Unity systems such as particle effects, sprite changes, and trigger zones. The concept, while ridiculous, let me make the funny game.

During the building process, I have multiple problems. One major challenge was getting the particle system to behave the way I wanted, since initially the "Pee" stream kept stopping after a short time. I had to adjust settings such as looping, lifetime, and emission rate to make it continuous. I also struggled with zone detection for win/lose conditions. Console logging and simple custom scripts helped me solve this by explicitly tracking whether the player was inside the safe zone while performing the action.

If I were to improve my process next week, I would plan more carefully before jumping straight into coding. For this project, I have too much interesting thinkings about making this game, but when I add all of them to thg game, I find that it need much more time than I think, which created confusion later when bugs appeared. Next time, I would sketch out the states, transitions, and logic in a game and make them simple before start making the game. I would also work in smaller steps, building and testing one mechanic at a time, instead of trying to add multiple systems at once. This would make debugging smoother and reduce wasted effort.

As for the future potential of this game, I think it has value as a short, humorous mini-game but limited commercial prospects. The exaggerated concept of balancing or hiding while performing wierd behaviors works well as a quick comedic challenge, but it likely would not sustain player interest over a full game. However, the idea could be developed into a party mini-game collection or integrated into a set of funny microgames where players try to survive under silly conditions.
